Experiment 11: Neural Network Using TensorFlow/Keras

Aim:

To build and train a basic neural network using TensorFlow/Keras for the given dataset.

Algorithm:

1. Import the required libraries.
2. Load the dataset and prepare the input features and target variable.
3. Create a Sequential neural network model.
4. Add Dense layers with suitable activation functions such as ReLU and sigmoid.
5. Compile the model using the Adam optimizer and binary cross-entropy loss function.
6. Train the model using the training data for the specified number of epochs.
7. Evaluate the model's performance on the test data.

Result:

Thus, a neural network was created and trained successfully using TensorFlow/Keras to learn patterns from the given dataset.
